Tool Relocation

Moving a tool to a new bay, a new fab or a new site? Relocation is more than transport from A to B. We support you from planning through decommissioning, re-installation and functional test, so your tool is back in production fast.

Your need

Do you find yourself answering yes to any of these?

- Are you moving a tool within your fab, to another site or into a new facility?
- Do you want certainty that nothing gets damaged or lost during de- and re-installation?
- Planning a move and unsure how long your tool will be out of production?

Our service

When relocating your tool, we support the full process from planning to restart. This helps you resume production quickly and efficiently with minimal disruption.

Planning – pre-checks on- and off-site (conditions, organization, logistics), an initial “fingerprint” of the system including baseline performance data and planning of the de-installation and re-installation.

Execution – decommissioning, re-installation and HW-commissioning, start-up, functional test and handover to production, plus “docking” support to integrate the tool into your production line.

You can engage us for single tasks or as a package:

- ✓ **light** – planning, pre-checks, baseline data, dismantle, re-installation, start-up
- ✓ **standard** – adds Health Check, functional test and handover
- ✓ **full** – adds organization of transportation

Your standard tool reference data is checked against the pre-move baseline (old vs. new location) and updated in our systems. Transport, insurance and reconnection of services remain with you; additional parts needed for re-installation are billable.

Your benefit

- Minimize downtime. A planned relocation gets your tool back into production faster.
- Free up your internal resources – your team only manages the physical move and service reconnection.
- Have qualified Evatec Field Service Engineers on-site if transport damage or unexpected issues appear.
- Baseline comparison confirms your tool performs at the new location as it did at the old one.

Want to know more?

Tool Relocation works well on its own and even better combined with a full Health Check before the move, so obsolescence and upgrades can be addressed while the tool is already down.
